

OaaS for Business: Protecting Corporate Value, Reputation, and Assets

Challenges Today:

Your company is under constant attack for corporate espionage, insider threats are stealing Intellectual Property, and competitors seek to damage your company and executive reputations.

Adversaries impersonate your key leaders to mine contacts for phishing attacks.

Your company has no way to detect cyber bullying which could lead to workplace violence.

Mission Impacting Outcomes:

OaaS quickly takes down a fake company account pointing consumers to a competitor.

OaaS takes down an impostor executive LinkedIn account attempting to harvest key employee contact information.

ALERTS when company sensitive information shows up for sale on the deep/dark web; also assists in tracking the source of the stolen IP.

Prevent workplace violence driven by cyber bullying.

Solution:

You can leverage OaaS today to quickly terminate imposter accounts, identify stolen company digital assets on the dark web, and restore malicious modifications to company online digital assets.

You can protect the company reputation, stock value, and executive personas online.

Identify cyber bullying early in time to intervene.

Current Operational Deployments:

OaaS service components are in use across DoD, IC, and in commercial environments for mission planning and battlefield force protection—understanding the digital environment around them.

Companies use OaaS components for facility, executive, and employee protection.
